## Emergency Chemical Spill Response Plan

Compared to producing ethanol from corn, producing ethanol from cellulosic biomass is a more recently developed process.

## Spill response plans

Electrical equipment must be rated for class II hazardous location ; NFPA 70. This separation is performed because the germ does not contain the starch that is needed to produce ethanol.

## Response Manual for Combating Spills of Floating Hazardous Chemicals

Outlines safety requirements for containers and components for ammonia handling and storage. The use of electrical equipment and wiring classified for Class II locations is essential to preventing electrical devices from becoming sources of ignition. Where the special hazards of operation, sources of ignition, or exposures indicate a need, consideration must be given to providing protection by one or more of the above means.

## OSHA Technical Manual (OTM)

Respiratory protection is required if the liquid releases corrosive vapour or gas. Also, there is little need to store large quantities of chemicals, as orders are generally shipped the day after an order is received.
