Illustrated genera of imperfect fungi

Among the selected five endophytic used for antimicrobial activity screening, the *Raffaëlea* sp. A total of twelve endophytic fungal species were successfully isolated, from which five were selected and presumptively identified, including *Aspergillus niger*, *Raffaëlea* sp. In lab 4, we observed the different spores produced by *Neurospora* sp.

First, I may not have cooled my probe by sticking it in the agar after flaming before collecting spores from the culture.

There are a couple of reasons I can think of for why my crosses and inoculations did not work the first time.

Inoculation of Healthy Corn with *Ustilago maydis* We then each inoculated our own corn plants with *U. Neurospora* provided the best example of this, with spores that differed in size, pigmentation, and morphology. For the first half of lab 5, I observed different cultures of the conidiating Hyphomycetes.

Observing the plate of this culture revealed a vastly different scene than the previous plate, as orange macroconidia were clearly visible, covering the entire surface of the agar unfortunately, I did not document this via photography.
