Unlike an , a steam engine burns its fuel outside the engine. Whether in heating a building or a kettle of water or in a natural condition such as a thunderstorm, heat transfer usually involves all three processes.

In many cases, however, treatment of the fluid can reduce the amount of biological growth.

Temperature transfer

Convection involves the movement of heated material—whether it is air, water, or some other fluid. This is the same as the conservation of energy. The history behind the derivation of these laws is discussed in the essay on Thermodynamics; here, the laws themselves will be examined in brief form.
