### PDB

This section is organized by target class, a choice aimed at providing the reader an appreciation of the structural diversity generated for each class. This puckering coordinate system is compared to existing reduced parameter systems to describe rings using a cyclohexane mol.

### Introduction: Bond Specific Spectroscopy of Peptides and Proteins

Figure 5-16 Structure of the pentapeptide serylglycyltyrosinylalanyleucine, or Ser-Gly-Tyr-Ala-Leu.

### Stability studies of proteins and peptides.

A chemical approach to this problem is outlined at the end of this chapter see Box 5-2. RMSD, functional group or fragment selective treatments are possible facilitating the investigation of catalytic processes where, for example, only the substrate is thermally activated. On the right is LL-37 PDB entry, which forms an alpha helix much like dermcidin.

### Wrinch Small Peptides

Potential applications of this study in computational lead discovery and structure-based design are discussed. The half-chair conformation exhibits strong coupling between phase angles.

### Structure peptide

These relationships hold for both simple monocyclic rings and complex bi- and polycyclic rings. The enkephalin receptors also bind morphine, heroin, and other addicting opiate drugs although these are not peptides.
