Theory of water

In domestic this shock wave is experienced as a loud banging resembling a hammering noise. Skalak's theory predicts that the spreading of wave fronts due to FSI is small, at most of the order of 10 pipe diameters.

[PDF] A Review of Water Hammer Theory and Practice

Water hammer can cause pipelines to break if the pressure is high enough.

Surge

A valve acts in effect like a constriction that increases head losses. This paper presents an overview of both historic developments and present day research and practice in the field of hydraulic transients. If the pressure in a pipeline drops below the of the liquid, will occur some of the liquid vaporizes, forming a bubble in the pipeline, keeping the pressure close to the vapor pressure.

Surge

Although it was prefigured in work by , the theory of water hammer is generally considered to have begun in 1883 with the work of German physiologist 1853—1928 , who was investigating the pulse in blood vessels. Unrestrained, 256 cubic metres 67,600 US gal per second of water began to spray all over the generator hall.
