Giordano was elected to the European Academy of Science and Arts. Whether a claim about a model can be extrapolated depends, he argues, also on the strength of the claim to be exported. It can now be shown that under the probabilistic theory and a host of other assumptions including the assumption that randomization has been successful in that the treatment groups are balanced with respect to prognostic factors , if the treatment status variable is correlated with the outcome variable, then the treatment must cause the outcome Cartwright 2007.
