These basics information can be easily forgotten once you get involved in a very specific discipline therefore it's very important to know.

Geological Interpretation of Well Logs

Flowmeter logs can be collected under non-pumping and or pumping conditions. Radar measurements can be made in a single borehole transmitter and receiver in same borehole or by cross-hole tomography transmitter and receiver in separate boreholes.

Affiliations and Accreditation PhD Imperial College - Volcanology Courses Taught N003: Geological Interpretation of Well Logs N033: Characterisation, Modelling, Simulation and Development Planning in Deepwater Clastic Reservoirs N095: Integrating Core and Log Data for Reservoir Characterisation Martin Kennedy Background Martin Kennedy, is a consultant petrophysicist based in Perth, Western Australia. Petrophysics, that is, the use of logs for quantifying hydrocarbons is also considered, but only briefly. In this class, each individual logging tool is described in terms of basic functions, physical principles and geological interpretation.

Users can visualize, analyze and create presentation logs, maps, cross sections and montages, as well as delineate reserves, in a process that maximizes data resources and minimizes the time required to create and present the total play concept. . The interactive display allows users to select logs from wells displayed on the map layer and quickly correlate logs or create cross sections.

The Geological Interpretation of Well Logs

Borehole-geophysical logging can provide a wealth of information that is critical in gaining a better understanding of subsurface conditions needed for ground-water and environmental studies. Borehole geophysics is the science of recording and analyzing measurements of physical properties made in wells or test holes. The consists of probes, cable and drawworks, power and processing modules, and data recording units.

Single-point resistance logs are useful in the determination of lithology, water quality, and location of fracture zones.

Borehole Geophysics

The most significant naturally occurring sources of gamma radiation are potassium-40 and daughter products of the uranium- and thorium-decay series. Typical spacing for potential electrodes are 16 inches for short-normal resistivity and 64 inches for long-normal resistivity.
