As 2020 Closes, Many Questions Remain about Youth Substance Use Trends

Although reduced brain response during decision making has been linked to increased relapse risk in adults, studies are needed to see if such predictions can be made with adolescents, and if dampened activation can be modified to produce more favorable treatment outcomes. Evidence from Internet-based interventions, policy initiatives, and incentives appears to be mixed and needs further research.

Adolescent substance abuse: Research and clinical advances — University of Miami's Research Profiles

Within the past year, 21% of eighth grade students reported that they had consumed alcohol, and 8% reported that they had been intoxicated; these numbers skyrocket to 58% and 38%, respectively, for twelfth grade students. Each of the studies illustrated innovative approaches to incorporating basic science applications in clinical research design and highlighted a number of the key challenges of conducting translational

research. Development of workshop: background and significance On June 19, 2006, The Society for Adolescent Substance Abuse Treatment Effectiveness SASATE sponsored a workshop at the 68th Annual Meeting of the College of Problems on Drug Dependence CPDD on advances in neurobiological research and its relevance and application in the treatment of adolescents with substance use disorders.
