## Adaptive Volterra Filter for Parallel MRI Reconstruction

Day A Gaussian quadrature method for the numerical solution of the Goursat problem. For the actual implementation, complete reconstruction of the analog signal is not necessary, since the desired intermediate values can be calculated with a high degree of accuracy by all-digital means via an interpolation of the digital samples.

Claims 20 an input low-pass filter 1 receiving said input data sequence d1 for outputting a first data sequence d4 in response to a digitization clock frequency of a clock signal f1, said input low-pass filter having an attenuation characteristic tp1 of at least one first attenuation value a1 substantially corresponding to between one-half and 1.

Such filter combinations are exhaustively described, for example, in an article by T. It's only here to demonstrate the general procedure of creating

an anti-aliased memoryless nonlinearity.
