Lessons in Music for the Healthy Aging Brain

Error bars are ± 1 standard error of the area statistic. Working memory in primate sensory systems.

Ageing vision and falls: a review

They found that older adults exhibited a selective deficit in suppressing task-irrelevant information during visual working memory encoding, but only in the early stages of visual processing. The bottom section of the bifocal lens allows wearer to focus in near distance while the upper section allows them to focus in a far distance.

Modeling the effects of irrelevant speech on memory

On each frame transition dots were displaced by 11. Disturbance effect of music on processing of verbal and spatial memories.

Impact of pressure as a tactile stimulus on working memory in healthy participants

To do so, healthy participants were asked to perform a visual n-back paradigm 0-back, 2-back combined with pressure as a sensory stimulus. The thick lines represent the pressure dark and without the pressure light block condition.

Psy 342

The finding that age and individual differences in working memory capacity relate to filtering efficiency in different ways is important beyond the question of age differences in working memory. The effect of auditory background did not reach statistical significance $F(3, 11)$. Attention to touch modulates activity in both primary and secondary somatosensory areas.
