Molecular Genetics of Colorectal Neoplasia

Specimen Submission, Handling, and Referral CLIA requires laboratories to establish and follow written policies and procedures for patient preparation, specimen collection, specimen labeling including patient name or unique patient identifier and, when appropriate, specimen source, specimen storage and preservation, conditions for specimen transportation, specimen processing, specimen acceptability and rejection, and referral of specimens to another laboratory 42 CFR §493. QMS has been the basis for many international quality standards, such as the International Organization for Standardization ISO standards ISO 15189, ISO 17025, and ISO 9001 91,139,140.

Syllabus

Both the government and professional organizations have developed educational materials that provide guidance to consumers, laboratories, genetics professionals, and professional organizations regarding DTC genetic tests 80--82. J Public Health Oxf 2007;29:246--50.

A standardized framework for the validation and verification of clinical molecular genetic tests

The recommended practices address the total testing process including the preanalytic, analytic, and postanalytic phases, laboratory responsibilities regarding authorized persons, confidentiality of patient information, personnel competency, considerations before introducing molecular genetic testing or offering new molecular genetic tests, and the quality management system approach to molecular genetic testing.

The Potential of Molecular Genetic Analysis for Diagnostic and Prognostic Decision Making in Clonal Cytopenia of Undetermined Significance (CCUS) and MDS

In two thirds of MDS and one third of CCUS patients mutations can be identified that allow personalized treatment based on respective molecular genetics even independent of other currently used diagnostic labels.
