

Meat and meat products in human nutrition in developing countries

Food and Agriculture Organization of the United Nations - Lab

Description: -

- Nutrition.

Meat.

Developing Countries.

Food of animal origin -- Developing countries.

Meat industry and trade -- Developing countries.

Nutrition -- Developing countries. Meat and meat products in human nutrition in developing countries

- Yi Sang Munhaksang susang chakka taep'yo chakp'umsön -- 1 53

FAO food and nutrition paper, Meat and meat products in human nutrition in developing countries

Notes: Includes bibliographical references (p. 55-58).

This edition was published in 1992

Countries Who Consume the Least Meat

Their contribution to improving nutrition in Developing countries Biplab K.

Feeding the Developing World: Six Major Challenges

In a bid to reduce meat consumption in their nations, states such as Denmark intend to increase taxes placed on red meat. It has also been observed that a reduction in meat consumption reduces the effects of global warming. When using height, weight and hemoglobin levels as a proxy for nutrition levels, improved nutrition led to a reduced likelihood of death in the Philippines, Kenya and Bangladesh.

United Nations Climate Report Suggests People Should Eat Less Meat

Red and processed meat consumption and risk of stroke: a meta-analysis of prospective cohort studies. Researchers hypothesize that cultured meat could lead to monumental changes in meat production, perhaps replacing factory farming or increasing demand for small-scale farming.

Rising global meat consumption 'will devastate environment'

Such efforts would also impart positive impacts on human health through reduction of diseases of nutritional extravagance. Potential Impact on Health Cultured meat can be engineered to have an impact on specific health and nutrition outcomes by altering the profile of essential amino acids and fat in addition to adding vitamins, minerals and bioactive compounds that match or exceed the amount in natural meat.

Global Production and Consumption of Animal Source Foods

The rise of such noncommunicable diseases in both wealthy nations and poorer countries is partly due to declining physical activity and excessive food energy intake. Consumption of meat and milk, driven by population increase, urbanization and rising incomes in developing countries, is forecast to increase faster than that for any crop product.
