Proceedings of the Royal Society B: Biological Sciences. A knowledge of which organisms existed during which periods is useful. There is also a brief introduction to the subject, stratigraphical tables that show British Mesozoic rock formations, and a colour map of the distribution of Mesozoic strata.

## Fossil Hunting Guide

Birds became increasingly common and diversified into a variety of and forms. Over a short period of time the tree tissues decay leaving an empty chamber inside the rock, some examples even preserve the texture of the outer bark on the walls of the mould.

## British Mesozoic Fossils

The earliest members of the genus first appeared during the Middle Jurassic.

Above: A hard-hat is recommended in areas where falling rocks may occur. To finish off use a couple of elastic bands to hold the foam in place. Dinosaurs first appeared in the Mid-Triassic, and became the dominant terrestrial vertebrates in the Late Triassic or Early Jurassic, occupying this position for about 150 or 135 million years until their demise at the end of the Cretaceous.

## Mesozoic

I have other earlier publications but as names are updated after a while it was a important buy to keep my records as a collector up to date including the names of the fossils host rock formation. By the end of the era, the continents had rifted into nearly their present forms, though not their present positions.

## **Fossil Hunting Guide**

Discovering Fossils guided fossil hunts reveal evidence of life that existed millions of years ago. What tools and equipment will you need? As ever the book is clear and easy to understand, especially for novice collectors. Above: Fossil hunting on the beach at in East Sussex.

In this example if the molten rock cools and hardens in less time than it takes to turn the tree to ash, then the hardened rock may form a solid mould around the tree. Thus, the abundance of fossils reflects the immense number of organisms that have lived and the vast length of time over which the rocks have accumulated. Recent research indicates that it took much longer for the reestablishment of complex ecosystems with high biodiversity, complex food webs, and specialized animals in a variety of niches, beginning in the mid-Triassic 4 million to 6 million years after the extinction, and not fully proliferated until 30 million years after the extinction.
