Women farmers : environmental managers of the world

Chemical soil degradation processes include relatively simple changes, like nutrient depletion resulting from the imbalance of nutrient extraction on harvested products and fertilisation, and more complex ones, such as acidification and increasing metal toxicity. .

THE 17 GOALS

The fourth UNU Global Environmental Forum took place in Osaka, Japan, on 25 May 1995.

Why Traditional Knowledge Holds the Key to Climate Change

Modelling of the changes in land degradation that are a result of climate change alone is hard because of the importance of local contextual factors. .

Land

In tropical and sub-tropical regions, the on-site impacts of soil erosion dominate, and are manifested in very high rates of soil loss, in some cases exceeding 100 t ha⁻¹ yr⁻¹ Tadesse 2001 ; García-Ruiz et al. . .

Population, land management, and environmental change : UNU Global Environmental Forum IV (Book, 1996) [spaceneb.us.to]

To further illustrate the complexity, livelihood assessments often focus on a single snapshot in time. .

Publications

World Resources Institute, Washington, DC. The study also suggested, contrary to earlier assessments Middleton and Thomas 1997 , that

drylands were not among the most affected regions. However, there is now clear evidence that the yield increases have reached or will soon reach their limits, with most farmers already using improved varieties and techniques.
