Applying these very simple geographical truths to the North Atlantic continents, it is easy to perceive that no amount of refrigeration could produce a continental glacier, because there could not be sufficient evaporation and precipitation to afford the necessary snow in the interior. The facts stated and questions discussed in this work have occupied some portion of the attention of the author since 1855, and he has from time to time published his results in the Canadian Naturalist and Geologist, and elsewhere.

Some errors may persist, however we consider it worth publishing due to the work's historical value. These boulders being of rocks foreign to Prince Edward Island, the question of their source becomes an interesting one. In 1872 the subject up to that time was summed up in a pamphlet of about 100 pages, entitled Notes on the Post-pliocene of Canada, now out of print; but since that date no general work on the subject has appeared, though many separate memoirs and papers have been issued by the author and other Canadian geologists.
