current stimulation. A threshold and loudness match was obtained at 3.

HENRY et al. Tinnitus pitch matching via computer

Single sessions of high-frequency rTMS over the temporal cortex have been successful in reducing the intensity of tinnitus during the time of stimulation and could be predictive for treatment outcome of chronic epidural stimulation using implanted electrodes. When the same calculations were made for the Octave procedure, the mean of the differences was 2394 Hz

Auditory frequency selectivity and tinnitus

Contradictory to our predictions we did not find differences between HDT and HC in any of the hypothesized regions. These historically consistent findings raise the concern that if studies report tinnitus pitch matches without repeated measurements, the accuracy of the single measurements must be questioned. It was found that 9 of 10 patients with 15 88.

The psychological treatment of tinnitus: An experimental evaluation

Tinnitus

It is the perception of the individual with tinnitus that is important. Joos et al 2015 noted that recently tRNS applied over the auditory cortex induced a more pronounced effect on tinnitus loudness than transcranial direct current and alternating

Biofeedback is a technique in which a person learns to gain control over unconscious bodily functions, such as the triggers that cause tinnitus.
Feldmann H 1971 Homolateral and contralateral masking of tinnitus by noise-bands and by pure-tones.

Alleviation of mortality induced by salicylate and stress

The words were presented in a randomized order and each word was presented twice per block. The author concluded that sigmoid sinus dehiscence is a rare but treatable cause of pulsatile tinnitus. Idiosyncratic word stimuli relevant to tinnitus- related concerns should be used as stimulus material in a sample of HDT who should be scanned twice; before and after a cognitive behavioral intervention.
