Dilemma-focused intervention for unipolar depression: a treatment manual

Gillian Hales¹ and Paul A. Maruff^{1,2} 

Abstract

Background: This article introduces a new treatment approach for depression. Based on previous research which indicated the majority of cognitive deficits in depression are due to an attentional bias to address these deficits, the Dilemma-focused Intervention (DFI) was developed. The DFI is a brief, low-intensity intervention which has been developed to reduce the negative, attentional bias of the individual. It can be delivered face-to-face, over the phone, or via email. The DFI has been developed for individuals with mild to moderate depression, and has been shown to be effective in reducing symptoms of depression in individuals with major depressive disorder or dysthymia. Deltad阻滞劑 was found to be effective in reducing symptoms of depression in individuals with mild to moderate depression.

Results: Accordingly, the current manual details the theoretical framework in this case, the rationale for the intervention, the intervention process, and the outcome measures used to evaluate the intervention. The manual has been designed to be used by mental health professionals, and can be used in conjunction with cognitive behavioral therapy (CBT), or as a stand-alone intervention. The DFI is a brief, low-intensity intervention, and can be delivered face-to-face, over the phone, or via email. The DFI has been developed for individuals with mild to moderate depression, and can be used in conjunction with CBT, or as a stand-alone intervention. The DFI has been developed to reduce the negative, attentional bias of the individual, and has been shown to be effective in reducing symptoms of depression in individuals with major depressive disorder or dysthymia. Deltad阻滞劑 was found to be effective in reducing symptoms of depression in individuals with mild to moderate depression.

Conclusion: The Dilemma-focused Intervention manual aims to improve the treatment of depression by offering an alternative to CBT, or as a stand-alone intervention. The DFI has been developed to reduce the negative, attentional bias of the individual, and has been shown to be effective in reducing symptoms of depression in individuals with major depressive disorder or dysthymia. Deltad阻滞劑 was found to be effective in reducing symptoms of depression in individuals with mild to moderate depression.

Background

Depression is a common mood disorder, with a prevalence of approximately 10% among adults. There are numerous subtypes of depression, and in some cases different diagnostic criteria are used. In a recent study, the authors identified three distinct types of depression: chronic depression, acute depression, and brief depression.  

Chronic depression is characterized by a persistent low mood, and is often associated with a range of physical and psychological symptoms. Acute depression is characterized by a sudden onset of symptoms, and is often associated with a range of physical and psychological symptoms. Brief depression is characterized by a brief episode of depression, and is often associated with a range of physical and psychological symptoms.  

Acute depression is often associated with a range of physical and psychological symptoms. Brief depression is often associated with a range of physical and psychological symptoms.  

The Dilemma-focused Intervention (DFI) is a brief, low-intensity intervention which has been developed to reduce the negative, attentional bias of the individual. It can be delivered face-to-face, over the phone, or via email. The DFI has been developed for individuals with mild to moderate depression, and has been shown to be effective in reducing symptoms of depression in individuals with major depressive disorder or dysthymia. Deltad阻滞劑 was found to be effective in reducing symptoms of depression in individuals with mild to moderate depression.

Why Bad Guys Think They're Good Guys

Though in a bit of retribution, he dies very suddenly before he could work off the bad karma his evil deeds would have accumulated. One of my biggest pet peeves about many story villains is that they walk around twisting the ends of their mustaches and declaring that they are the bad guys. The issue is about domestic violence.
