## Towards an Optimal Account of Second Position Phenomena

Empty categories, case, and configurationality. These considerations strongly suggest that the participle-auxiliary order in Bulgarian is the result not of prosodic factors, but of participle raising that is syntactic in nature—i.

### do second

Namely, the participle V agrees with the external argument and the  $\phi$ -features V acquires percolate to VP; then T agrees with VP in  $\phi$ -features, rather than with the external argument in an example like 9a. In contrast, since DP and AP complements to the copula are phases, they must be maximal extended projections of their respective lexical heads, N and A, while the copula is itself a lexical rather than a functional item anchoring its own extended projection the clause. In addition, the observed tendency towards adjacency is still consistent with movement of the participle to a specifier position, especially if the participle lands in the specifier of the auxiliary: since a head and its specifier tend to be linearized next to one another, the apparent surface adjacency between a fronted participle and the finite auxiliary is unsurprising.

## Approaching Second: Second Position Clitics and Related Phenomena

It may, for example, be the case that the stranded material moves out of the VP prior to the fronting of the remnant VP or is base generated outside the VP. Past active participles in Bulgarian are canonically pronounced to the right of the finite auxiliary verb, as in the examples below.

Instead, they can be introduced as part of the projection of the finite auxiliary for discussion of how theta role assignment needs to work under this proposal and other necessary assumptions, see. Clitics and Configurationality in Ancient Greek, Ph. Aspects of the theory of clitics.
