### Renal Failure and Replacement Therapies

Indications for Initiation of RRT The indications for initiation of CRRT generally correspond to overall indications for RRT , including volume overload, severe metabolic acidosis and electrolyte disturbances, and overt uremic symptoms. If you decide not to begin dialysis treatments, you may live for a few weeks or for several months, depending on your health and your remaining kidney function.

### Renal replacement therapy in the intensive care unit

Wu VC, Ko WJ, Chang HW, Chen YW, Lin YF, Shiao CC, et al. Reducing the hemorrhagic complications of dialysis: a controlled comparison of low dose heparin and citrate anticoagulation. Although tunneled catheters are not recommended for routine use, they are associated with decreased risks of infection and higher blood flow rates, and should be considered when the need for RRT is expected to exceed 1 to 3 weeks.

### Renal Failure and Replacement Therapies

Misset B, Timsit JF, Chevret S, Renaud B, Tamion F, Carlet J. For those patients receiving RRT, the median time from reaching stage 3 AKI to randomization was 4.

### Principles of Drug Therapy, Dosing, and Prescribing in Chronic Kidney Disease and Renal Replacement Therapy

The development of renal failure is an independent predictor of mortality in this patient population ;. No differences in the overall outcome were observed in subgroup analyses of 348 patients with septic shock and 207 patients with ARDS.

### Choosing a Treatment for Kidney Failure

Low molecular weight heparin versus standard heparin. A study comparing CRRT to alternate day IHD showed CRRT to be significantly more expensive, primarily because of the cost of CRRT fluid.
