Similar situations may occur with fractures, although a patient who has a nondisplaced fracture of the radial head and is treated with aggressive rehabilitation should perform well at 6 to 8 weeks, except in elbow-loading sports such as gymnastics. Vascular symptoms, which are usually limited to acute injuries such as fractures or dislocations, should be aggressively investigated.

Authoritative guidance from leading experts enables you to provide optimal care to your patients — even those with the most challenging elbow problems.

**[PDF] Morreys The Elbow And Its Disorders**

Varus or valgus shear forces at the time of impact may cause a fracture of condylar and supracondylar structures, but this injury is more common in children. Analgesics, anti-inflammatory drugs, and cortisone injections are used selectively and sparingly for comfort to aid in the progression of rehabilitative and fitness exercises.

## **Assessment and Treatment Guidelines for Elbow Injuries**

Chapters in this detailed book will look at the most common types of elbow trauma and how to manage complications in surgery.
