The Searchers: How Will NASA Look for Signs of Life Beyond Earth?

Landsat 4, launched 16 Jul. NASA Dryden engineers and pilots began developing the system in the wake of a long series of failures of hydraulic flight control systems in the 1970s, three of which resulted in crashes claiming the lives of over 1,200 people.

NASA Artemis

Chandra was designed to study black holes, supernovas and dark matter in greater detail than previously possible to increase our understanding of the origin, evolution and destiny of the universe. It contributed equally to the development of all commercial transport aircraft from the mid-1950s to the present. Individual topics addressed include: the NASA cosmic ray CR program for the 1990s and beyond, SAMPEX Mission overview, the Advanced Composition Explorer, Positron Electron Magnet Spectrometer for the Eos Mission, Heavy Nucleus Collector for Space Station, the Astromag Facility, Large Isotope Spectrometer for Astromag, the Solar Probe Mission, the Mercury Dual Orbiter Mission, CRs in the heliosphere, origin of high-energy Galactic CRs, CR studies with the Gamma-Ray Observatory, gamma-ray astronomy at 1 TeV, experimental search for point sources above 1 TeV, the UMC Extensive Air Shower Array, status of the MACRO experiment.

Gases in these atmospheres will block out certain slices of the spectrum in this starlight, in a way that scientists can read like a bar code — a light-sifting method known as spectroscopy. It resulted in more than 765 research reports and provided significant data in a variety of hypersonic disciplines ranging from aircraft performance, stability and control, aerodynamic heating, the use of heat-resistant materials, shock interaction, and use of reaction controls. As the mission progressed, with the successful achievement of all its objectives at Jupiter and Saturn in Dec.

CHRONOLOGY OF DEFINING EVENTS IN NASA HISTORY

Planets like Earth, Jupiter, and Saturn generate their magnetic fields by means of a dynamo made up of moving molten metal at the core. In 1993, at the end of its mission, NASA's Jet Propulsion Laboratory shut down the major functions of the Magellan spacecraft and scientists turned their attention to a detailed analysis of its data. In orbit the crew conducted solar astronomy and Earth resources experiments, medical studies, and five student experiments.

Pacific Standard Time on 14 Apr.

NASA Just Cancelled its Advanced Spacecraft...

Critics of the NASA program called for even more ambitious goals, most prominently an expansion of manned space flight to the Moon or Mars.
