The Barus viscosity—pressure relation is The typical values of viscosity-pressure coefficient a for several lubricants are listed in Table 3. Garter springs are fitted to ensure rod contact. However, experimental measurements show that the traction curve rises linearly from pure rolling zero traction and reaches a plateau at a certain slip ratio in the so-called nonlinear isothermal region shown in Figure 12.

The sealing faces on the rings and cups are accurately ground or lapped. The half- width of contact and the maximum Hertzian contact pressure are functions of the load per unit length, the equivalent curvature radius, R, and the equivalent elastic modulus, E.
