Geochemical and Isotopic Heterogeneities along an Island Arc

Government of Newfoundland and Labrador, Department of Mines and Energy, Geological Survey.

Origin of mineral chemical stratification in the mantle section of the Table Mountain massif (Bay of Islands Ophiolite, Newfoundland, Canada)

The modelled parental melts have relatively flat REE patterns, which are similar to those calculated for the SH boninite-type pyroxenitic dykes, but shifted to higher concentrations. In Lithostratigraphy of the Cambrian? For modelling, two samples of each suite were chosen see text for details. Both the intermediate and basal mantle rocks fit into a progressive partial melting trend.

Sailing directions for the islands of Newfoundland and coast of Labrador [microform] : including the...

The manuscript benefited greatly from constructive reviews by J. Microstructurally, the undeformed dykes of the MBC and WLH are generally fine grained with granular to ophitic textures.

12G/09

Geological Survey of Canada, Memoir 400, 145 pages, enclosures 3 maps. Government of Newfoundland and Labrador, Department of Mines and Energy, Mineral Development Division. Petrographic descriptions Pyroxenite Suite The rocks of this study samples 95-69 to 95-94 and L686, are olivine clinopyroxenite, wehrlite, dunite and olivine websterite.
