**Symposium: the dead softwood timber resource. Proceedings of session held May 22, 23, 24, 1978, Spokane, Washington (Conference)**

Non-pine species are an important component of the salvage and these species are also essential for the future timber supply. Number of boards per Hunter category, parameter estimates, associated standard errors, P-values and standard deviation of the random-effects estimates for the four linear mixed-models testing the effect of Hunter classes in a MOE of  $2 \times 4$  lumber pieces, b MOR of  $2 \times 4$  lumber pieces, c MOE of  $2 \times 6$  lumber pieces and d MOR of  $2 \times 6$  lumber pieces Model.

**Lumber and wood chips properties of dead and sound black spruce trees grown in the boreal forest of Canada, Forestry: An International Journal of Forest Research**

Indeed, MSR lumber is usually graded according to its MOE, from which end-users can infer minimum MOR values. This defect is then halved and subtracted from gross volume to calculate the final cubic scale.

**Lumber and wood chips properties of dead and sound black spruce trees grown in the boreal forest of Canada**

The same predictor variables from the field study were measured on trees in the mill study, including mortality year.

**Timber supply and economic impact of mountain pine beetle salvage strategies**

The model was very sensitive to the intensity of attack and less sensitive to the decay level.
