An intellectual disability is not a disease.

### **Effects of rationalizing drug treatment of patients with epilepsy and mental retardation**

As pointed out by Campbell et al in their review of the literature, however, systematic research is lacking, and little is known about the efficacy and safety of beta-blockers in children and adolescents with pathologic aggression. The few available studies demonstrate that pregnant MDMA users exhibit a clustering of reproductive risk factors that contribute to neurobehavioral and teratological outcomes. This uncoupling is sustained into adulthood and is specific for D1 receptors.

Clinical reports of the impact of prenatal cocaine have been varied; some suggest global and severe physical malformations, others document specific deficits in physical, cognitive, and emotional development, and yet other studies indicate no effects. Chronic caffeine or theophylline intake during pregnancy inhibits A1 receptor function in the rat brain.
