The Construction of Mental Representations During Reading (1998, UK)

Just as dimensions of orientation, shape and colour may be mentally stimulated in language comprehension of visual objects, it is perhaps not surprising that both phonological and prosodic representations are simulated for understanding written speech. The results proved that the power of empathy with a fictional character helps prepare us for similar events in our own lives, which in turn make us more capable of psychologically dealing with future negative emotions or situations. That is, participants differed in how consistent their putting was, but not in how accurate each putt came to the target.

Similar to the mental practice group, the mental representation structure of the combined practice group was more elaborate after acquisition phase see. Specifically, 6 T10 CCD cameras captured and tracked the golf ball rolling and stopping, with a spatial resolution of approximately 0. The

results replicated more vivid speech simulations in silent reading of direct speech, and additionally extended them to the phonological dimension.
