Weather and climate in Western Australia

Western Australia has many types of climate, in the south-west, the climate is temperate, with winter rainfall June-August and four distinct seasons, to the north the climate is tropical with a wet season and a dry season April to November while in the rest of the land is arid or semi-arid. The weather is on the whole delightful, but it may perhaps be too mild. Thompson, after their residences had collapsed, got into a 400-gallon tank to save their lives, and remained there, up to their middle in water, till daylight.

Increasing demand for fresh water in coastal areas, rising sea level and variations in rainfall recharge may result in increased incidence of seawater intrusion to coastal aquifers, which can significantly degrade water quality and reduce freshwater availability.
