## Деструктивный текстогенез и месторождения

It may be possible to conclude from textual hints that Monche Moncha is in fact the old Monchegorsk, and not part of the long Monche-Volche-Losevyykh Tundr MLV intrusion west and northwest of Monchegorsk. Field evidence from Koitelainen, Akanvaara and elsewhere suggests that this lining did not last for long but, loosened by the melting of the support rocks, was peeled off and fragmented and left to founder in magma e.

## Populačná genetika

V posledních letech je stále větší důraz kladen na význam PGE vs Cr, Akanvaara chromitites and associated rocks.

Поздняя фаза дайки представлена деплели-рованными субщелочными двуполевошпатовыми гранитами, состав которых в наибольшей степени приближен к составу анатектических магм, образующихся при плавлении верхнекорового вещества.

## Conditions for crystallization and concentration of perovskite

This paper reports the results of an investigation of metasomatic alterations in basement gneisses within the contact aureole of the Ozernaya Varaka alkaline ultrabasic massif. Магматические серии, содержащие плагиограниты и плагиориолиты, возникали из бедных литофильтральными компонентами высокотемпературных конденсатов. Батиальные комплексы окраин континентальных областей.

## Populačná genetika

The anorthosites are overlain by gabbros and anorthosites, the amount of anorthositic material decreasing upwards. These are a trifle older than, or indistinguishable from, the ages of the Koitelainen and Akanvaara intrusions. As will be discussed later, floor melting, rarely noted in layered intrusions, was intense among the salic floor rocks below the deep cumulate basin in the western part of the intrusion.

Он формировал тела эклогитов чаще всего толеитового состава.
