## An intervention study

**Background** There was preliminary evidence that regular administration of aspirin may be of benefit to patients with known coronary heart disease. The Aspirin Myocardial Infarction Study AMIS was a multicenter, randomized, double-blind, placebo-controlled trial of 1. The sheer size and scale of this dome is a lasting testimony to the skills of ancient Roman architects and engineers.

## Top 10 Magnificent Examples of Ancient Roman Architecture

The combination of a trial by mail and the 2x2 factorial design allowed the Physicians' Health Study to be conducted at a fraction of the cost of a standard primary prevention trial. They included questions about compliance with the study treatments, use of non-study medications, occurrence of major illnesses or adverse effects, and other risk factor information. Three-year total mortality was 9.

## Aspirin in Myocardial Infarction Study

Maison Carrée is an architectural gem that stands 49 feet 15 meters tall and runs along a length of 85 feet 26 meters.

## An intervention study

Upon receipt in the PHS blood laboratory, samples were immediately frozen and stored in liquid nitrogen freezers.
